

# Alloying Elements and Properties of Steel

Here is a comprehensive list of are a few major alloying elements for steel, what they do, and what they are used for.

For clarity, there are no links. Look up these modules for explanations:

Illustration

Element	Stabilizes....	Hardness Increase Mechanism	Tendency to form hard Carbides	Major / Minor Functions
Manganese <b>Mn</b>	Austenite Open $\gamma$ -field	Moderate increase Powerful solution strengthener	Middle	<ol style="list-style-type: none"> <li>1. Takes care of <b>Sulphur (S)</b>.</li> <li>2. Makes special steels in high concentrations</li> <li>3. <i>Cheap</i> increase of hardenability.</li> </ol>
Silicon <b>Si</b>	Ferrite Closed $\gamma$ -field	Hardens, but <i>reduces ductility</i> Moderate increase	None	<ol style="list-style-type: none"> <li>1. Deoxidation ("killing") of <i>liquid steel</i>.</li> <li>2. Increases <i>electrical resistivity</i> (important for transformer cores).</li> <li>3. Improves oxidation resistance.</li> </ol>
Aluminum <b>Al</b>	Ferrite Closed $\gamma$ -field	Small Grain size hardening	No carbides but nitride.	<ol style="list-style-type: none"> <li>1. Deoxidation ("killing") of <i>liquid steel</i>.</li> <li>2. Improves oxidation resistance.</li> </ol>
Chromium <b>Cr</b>	Ferrite Closed $\gamma$ -field	Moderate increase (Secondary) prec. hardening	Strong	<ol style="list-style-type: none"> <li>1. Corrosion resistance.</li> <li>2. Strength + oxidation resistance at <i>high T</i>.</li> <li>3. <i>Abrasion resistance</i> (needs high <b>C</b>, too).</li> </ol>
Titanium <b>Ti</b>	Ferrite Closed $\gamma$ -field	Strong increase; Prec. hardening Grain size hardening	Extremely strong	<ol style="list-style-type: none"> <li>1. Oxygen, nitrogen and sulphur scavenger. Forms hard carbides. prevents grain growth.</li> <li>2. Prevents <i>local depletion</i> of carbon in stainless steels due to <b>Cr</b>-carbide formation</li> </ol>
Vanadium <b>V</b>	Ferrite Closed $\gamma$ -field	Very strong increase Prec. hardening Grain size hardening  Moderate solid solution hardening	Very strong	<ol style="list-style-type: none"> <li>1. <i>Restricts grain coarsening</i> of austenite.</li> <li>2. Increases hardenability.</li> <li>3. Delays softening during tempering.</li> </ol>
Nickel <b>Ni</b>	Austenite Open $\gamma$ -field	Mild increase	None	<ol style="list-style-type: none"> <li>1. Enables austenitic steels.</li> <li>2. Enables Invar steel</li> </ol>

<p>Molybdenum <b>Mo</b></p>	<p>Austenite Open <math>\gamma</math>-field</p>	<p>Strong increase Prec. hardening Grain size hardening</p>	<p>Very strong</p>	<p><b>1.</b> Improves <i>corrosion resistance of stainless steels</i>. <b>2.</b> Prevents <i>embrittlement</i> of certain <b>Ni/Cr</b> steels. <b>3.</b> Keeps strength at higher <b>T</b>. <b>4.</b> Provides high <i>abrasion resistance</i>.</p>
<p>Boron <b>B</b></p>	<p>? Major changes i at very small concentrations</p>	<p>Strong increase Prec. hardening Grain size hardening</p>	<p>Very strong</p>	<p><b>1.</b> High strength steel <b>2.</b> Nitrogen scavenger <b>3.</b> Replacement for expensive elements without compromising properties</p>
