| Learning outcome                             | <u>Knowledge</u><br>The lecture provides an in-depth understanding of thermodynamics and kinetics for material scientists. The lecture demonstrates the function of model systems, e.g. perfect gas, ideal solution etc. for the calculation of the materials properties. Modifications of the simple models represent a more realistic point of view, thus enabling the description of real systems<br><u>Skills</u><br>The lecture provides knowledge in practical fields, e.g. how the properties of materials and their technological |

|         |   |
|---------|---|
|         | <p>application are related to their thermodynamic properties. Examples for essential industrial products and processes are discussed in conjunction with their thermodynamic aspects.</p> <p><u>Competences</u><br/>The students learn to combine their skills in mathematics, physics and chemistry to the interdisciplinary aspects of thermodynamics and kinetics.</p>   |
| Content | <p>Basic properties of gases<br/> Model of the perfect gas<br/> Models for real gases<br/> Quantitative interrelations of the models<br/> Reduced variables and corresponding states<br/> The First Law<br/> Theory of state functions<br/> Heat and work<br/> Theory of heat capacity<br/> Enthalpy<br/> Joule- and Joule-Thomson experiment<br/> The Second Law<br/> Heat engines<br/> Entropy and spontaneity of processes<br/> Gibbs- and Helmholtz energies<br/> Chemical potential of real systems, fugacity and activity<br/> Physical transformations of pure substances<br/> Phase rule of Gibbs<br/> Simple phase diagrams (pVT-plots)<br/> Clapeyron's equation and its application to phase diagrams<br/> Ehrenfest classification<br/> Lambda transitions<br/> Phase Change Materials (PCM)<br/> High Performance Ceramics<br/> Simple mixtures<br/> Ideal vs. real mixture<br/> Entropy of mixing, excess enthalpies<br/> Partial molar quantities- theory and application<br/> Ideal and ideal dilute solutions<br/> Raoult's, Henry's law and deviations<br/> Activities of solutions<br/> Activity coefficients (Debye-Hückel theory)<br/> Phase diagrams<br/> Calculation of phase diagrams<br/> Practical aspects of binary and ternary phase diagrams<br/> Chemical equilibrium<br/> Equilibrium conditions<br/> Response of equilibriums to conditions<br/> Chemical vapor transport of solids<br/> Ellingham diagrams</p> |

|                                   |   |

| Credits                                      | 5  |
| Prerequisites according to examination order | none   |
| Recommended Prerequisites                    | Knowledge in Mathematics and Mechanics from Bachelor courses   |
| Learning outcome                             | <p><u>Knowledge</u><br/>The students will get a general overview over the mechanical properties of cells and their origin.</p> <p><u>Skills</u><br/>In particular, the course will enable the students to</p> <ul style="list-style-type: none"> <li>- predict the physical properties of polymers under given conditions and apply this knowledge to the most common biological polymers in cells.</li> <li>- use elasticity theory in two and three dimensions,</li> </ul> |

|                                   |  |
|-----------------------------------|--|
|                                   | <p>predict properties of networks with different number of coordination and symmetries, e.g. in membrane-associated networks.</p> <ul style="list-style-type: none"> <li>- estimate the forces between surfaces of living organisms, e.g. in adhesion processes.</li> <li>- understand the origin of simple motion of living organisms and design principles for e.g. achieving an optimum size.</li> <li>- have basic knowledge on experimental techniques for studying physical properties of living matter, in particular cell-material interactions.</li> </ul> <p><u>Competences</u></p> <p>A very important aspect of this highly interdisciplinary course is that the students will learn to understand the different language of biology and in this way increase their competence to carry out interdisciplinary research in general. By working with recent research articles, the students will learn to work with literature and get knowledge about the status of international research.</p> |
| Content                           | <p>The course focuses on the mechanical properties of living cells. Particular emphasis will be given to the interaction of cells and materials.</p> <p>Content of the lectures:</p> <ol style="list-style-type: none"> <li>1. Introduction to cell organization and structure</li> <li>2. Mechanical properties of polymers</li> <li>3. 2D and 3D polymer networks</li> <li>4. Intermembrane forces</li> <li>5. Dynamic filaments</li> <li>6. Molecular motors</li> <li>7. Mechanical design of cells</li> <li>8. Cell adhesion</li> <li>9. Imaging the cell-material contact</li> <li>10. Force measurements on cells</li> <li>11. Cell-material interactions</li> </ol> <p>In the exercises, current experimental and theoretical topics in cell mechanics will be discussed.</p>   |
| Assessment of course achievements | <p>During the examination period following the module, a written exam (duration: 120 min.) on "Cell Mechanics" is held.</p>  |
| Media                             | <p>Powerpoint presentation, blackboard, overheads, hands-on examples.</p>  |
| Literature                        | <p>David Boal: Mechanics of the Cell, Cambridge University Press, 2001.</p> <p>Additional literature (scientific articles, notes) will be handed out during the course.</p>  |

| Learning outcome                             | Modelling in theory and praxis, realization of stability analysis by the model of finite elements<br><br>Creation and optimisation of models, error free simulation, interpretation and critical review |

|                                   |  |
|-----------------------------------|--|
|                                   | Abstracting from 3D into 2D, understanding and assessing of mechanical treatment, communication with structure mechanics   |
| Content                           | Models in engineering and science are addressed in general. The terminology used to formulate field problems will be introduced. Modelling errors and their respective treatment based on model verification and validation are explained. The general structure of a FE program will be treated: necessary input data, flow of solution steps, post-processing of resulting data. The hybrid method of mechanical testing and FE simulation for parameter identification is illustrated and trained. The course will be accompanied with practical exercises using the commercial FE-code ABAQUS. |
| Assessment of course achievements | Four homeworks to hand in two weeks after issued<br>Written exam at the end of the semester  |
| Media                             | Powerpoint, blackboard   |
